

RRAMAC EdgeScout Connectivity on Secomea SiteManager™

Secomea's SiteManager hardware is part of the company's Industry 4.0 Certified remote access solution, which is used by major machine builders and system integrators all over the world. The solution consists of a software or hardware-based control unit that is installed at a factory (SiteManager), and a Web- or Windows-based client (LinkManager) operated by technicians or end-users. These two components are tied together via a central M2M communication server (GateManager).

RRAMAC's EdgeScout enhances Secomea's remote connectivity offering by providing a complete Industrial Internet of Things (IIoT) solution, including hosted data storage, web-based dashboards, custom smart phone apps, and alarm history. EdgeScout's analytics include predictive maintenance alerts, downtime reports, remote inventory tracking, energy management,

and other custom reports. EdgeScout interfaces with ordering and billing systems, maintenance management systems, and other enterprise software platforms in order to streamline the ordering of consumable goods or replacement parts at remote sites.

Simply plug in RRAMAC's EdgeScout USB dongle and configure the SiteManager to connect to RRAMAC's hosted server. RRAMAC will remotely configure communications and provide a turnkey IIoT solution for your equipment.
